MAXIMUM POSITION

INVESTMENT THESIS IN ONE SENTENCE

The portfolio is positioned to capture domestic convergence by overweighting the Indian consumer (Autos) ahead of the Q3 festive season, anchored by regulated utilities and resilient telecom infrastructure, explicitly isolating the portfolio from global commodity and IT margin volatility during the competition tracking window.

Strategy at a Glance

The Portfolio Playoff 2026 mandates a shift from traditional buy-and-hold philosophy to tactical portfolio management. The primary scoring metric (70%) relies on *actual realized returns* over a defined 30-day window. Consequently, our strategy is built upon three pillars:

- **Catalyst Identification:** We isolate sectors possessing time-bound market triggers occurring specifically within the tracking window (e.g., pre-festive auto dispatches, accelerated post-monsoon order execution).
- **Probability Weighting:** We evaluate opportunities not by their maximum theoretical upside, but by their likelihood of realization. A highly probable 4% appreciation receives priority over a speculative 10% return.
- **Risk Architecture:** Position sizing is dictated by downside protection. The portfolio relies on low-beta utility anchors to provide stable, positive carry, mitigating the impact of broader market corrections.

02
THE ARCHITECTS

Team Ctrl C + Ctrl V

The portfolio strategy combines quantitative data screening, structured market reasoning, and rigorous risk discipline.

Our Approach

Team Ctrl C + Ctrl V approaches portfolio management systematically. Rather than relying on generic company sentiment, we utilize data-driven screening to identify anomalies between fundamental strength and current market pricing. Our allocation philosophy ensures that risk is actively budgeted, and every capital deployment serves a specific tactical purpose within the overall portfolio anatomy.

03 THE MANDATE

Competition Framework

Objective

Portfolio Playoff, conducted by SARC (Student Alumni Relations Cell) at IIT Bombay, is an advanced virtual-money investment competition. The objective is to construct a tactical 10-stock portfolio from a restricted universe, predicting its performance over a live tracking window, and defending the underlying investment rationale.

Structural Mechanics

- **Phase 1 (Portfolio Submission):** Participants allocate a notional capital of ₹10,00,000 across exactly 10 eligible equities. Submissions require target prices and a 2–4 sentence defense for each position.
- **Tracking Period:** The portfolio is locked at Day-0 closing prices and monitored against actual live market movements.
- **Phase 2 (Final Pitch):** Shortlisted participants defend their portfolio construction, risk discipline, and thesis realization before a judging panel.

The Scoring Paradigm

The competition explicitly avoids rewarding blind speculation. The scoring matrix is asymmetric, emphasizing actual market execution:

1. **70% — Actual Portfolio Return:** Based strictly on real-world market performance, requiring highly probable investment selection.
2. **20% — Quality of Thesis:** Evaluates logical soundness, data support, and analytical depth over ungrounded optimism.
3. **10% — Diversification & Risk Discipline:** Assesses adherence to sector caps and position sizing sanity.

04
COMPLIANCE

Official Rules & Constraints

The portfolio has been rigorously audited against the official Problem Statement constraints. Compliance is confirmed across all parameters.

RULE	OFFICIAL REQUIREMENT	STATUS
Eligible Universe	Only the 30 specified stocks listed by SARC	COMPLIANT
Number of Stocks	Exactly 10 stocks must be selected	COMPLIANT
Virtual Capital	₹10,00,000 notional capital fully deployed	COMPLIANT
Maximum Position Size	No single stock may exceed 25% of capital	COMPLIANT
Maximum Sector Exposure	No single sector may exceed 40% of capital	COMPLIANT
Position Type	Long-only requirement	COMPLIANT
Short Selling	Strictly prohibited	COMPLIANT
Derivatives	Strictly prohibited	COMPLIANT
Leverage	Strictly prohibited	COMPLIANT

05

THE OPPORTUNITY SPACE

Approved 30-Stock Universe

The portfolio is constructed exclusively from the official 30-stock universe, preserving the exact SARC sector classifications.

STRATEGY DIFFERENTIATION

Our Investment Mandate

Long-Horizon vs. Competition Window

Constructing a portfolio for a 10-year retirement account requires prioritizing terminal value, secular growth trends, and dividend reinvestment. Constructing a portfolio for a strict 30-day competition tracking window requires an entirely different mandate.

In a short-duration contest, opportunity cost and drawdown sensitivity are paramount. An excellent company undergoing a temporary 30-day consolidation is a poor portfolio candidate, regardless of its 5-year outlook.

"Fundamentals provide the foundation; catalysts determine timing."

We require both. A catalyst without fundamental support is mere speculation. Fundamental support without a catalyst represents dead capital during the tracking window.

07

MACRO ENVIRONMENT

Market Regime

The competition window (Sept/Oct) aligns with a specific domestic market regime characterized by:

- 1. **The Festive Sprint:** Historically, Q3 inventory buildup and retail dispatches trigger positive volume surprises in consumer-facing sectors (Autos, Retail).
- 2. **Government Capex Execution:** Post-monsoon months traditionally see accelerated infrastructure execution and power demand stabilization.
- 3. **Global Headwinds:** Elevated crude prices, geopolitical uncertainty and global rate expectations increase volatility in export-sensitive and commodity-linked equities.

Sector Map

Sector	Stance	Portfolio Logic
Automobile	OVERWEIGHT	Explicit beneficiary of Sept/Oct festive dispatch data. Highest probability of near-term volume surprises.
Energy & Utilities	OVERWEIGHT	Regulated ROEs provide a volatility buffer. Transmission capex offers structural tailwinds isolated from consumer demand.
Telecom	OVERWEIGHT	ARPU expansion provides defensive growth independent of macro conditions.
Cement & Infra	OVERWEIGHT	Post-monsoon order execution accelerates revenue recognition.
Banking & Fin.	NEUTRAL	Valuations are reasonable, but lacks immediate idiosyncratic 30-day catalysts compared to Autos. Maintained for diversification.
IT & FMCG	UNDERWEIGHT	Export dependencies and stretched rural consumption valuations present unfavorable risk/reward for a 30-day sprint.
Metals & Mining	UNDERWEIGHT	Excessive sensitivity to global commodity cycles introduces unacceptable variance.

METHODOLOGY

PCAR Framework

To systematize our selection, Team Ctrl C + Ctrl V developed the **Probability-Weighted Catalyst Alpha & Risk (PCAR)** framework. This internal methodology filters out subjective bias.

- **PROBABILITY:** What is the mathematical likelihood of the thesis playing out *specifically* between the Day-0 lock and the final tracking date?
- **CATALYST:** Is there an identifiable near-term event (monthly auto dispatch release, pre-festive inventory build-up, tariff hike impact)?
- **ALPHA:** Does the equity demonstrate relative strength against the broader market index, indicating institutional support?
- **RISK:** What is the historical 30-day volatility (Beta), and does current valuation provide a technical floor?

Screening Funnel

The 30-stock official universe was filtered through the PCAR methodology to distill the final 10 portfolio candidates.

Quantitative Screening Weights

The internal model assigns the following weights to finalize selection:

- **35% — Near-Term Catalyst:** Highest weighting due to the short tracking window.
- **25% — Institutional Momentum:** Preference for existing uptrends.
- **25% — Downside Risk / Volatility:** Heavy penalty for high-beta unpredictability.
- **15% — Margin of Safety:** Preference for non-stretched valuations.

Model Limitation: The model intentionally sacrifices deep-value turnaround plays if they lack an immediate catalyst, acknowledging the opportunity cost inherent in a 30-day timeframe.

10

THE SUBMISSION

The Final 10

DATA NOTE

The official problem statement locks the portfolio at Day-0 closing prices (Sept 7, 2026). The Day-0 prices below are the actual NSE closing prices for 7 September 2026. Target prices are derived from the stated predicted returns, while allocations remain fixed at ₹10,00,000 virtual capital.

STOCK	DAY-0 PRICE	PREDICTED PRICE	PREDICTED RETURN	ALLOC.	VIRTUAL INVEST.
Power Grid Corp.	₹266.45	₹275.78	+3.50%	20%	₹2,00,000
Larsen & Toubro	₹3,999.00	₹4,158.96	+4.00%	15%	₹1,50,000
Tata Motors	₹459.65	₹487.23	+6.00%	15%	₹1,50,000
Bharti Airtel	₹1,854.00	₹1,937.43	+4.50%	15%	₹1,50,000
ICICI Bank	₹1,423.60	₹1,473.43	+3.50%	10%	₹1,00,000
M&M	₹3,160.00	₹3,318.00	+5.00%	10%	₹1,00,000
NTPC	₹330.75	₹340.67	+3.00%	5%	₹50,000
HDFC Bank	₹710.50	₹731.82	+3.00%	5%	₹50,000
Titan Company	₹4,995.00	₹5,169.83	+3.50%	3%	₹30,000
Maruti Suzuki	₹12,760.00	₹13,206.60	+3.50%	2%	₹20,000
TOTAL	—	—	+4.20%	100%	₹10,00,000

Portfolio Anatomy

- **Alpha Engines (40%):** Tata Motors, M&M, L&T. High-conviction tactical trades designed to aggressively capture event-driven momentum.
- **Defensive Anchors (25%):** Power Grid, NTPC. Regulated monopolies engineered to compress portfolio beta and mitigate drawdown risk.

- **Core Compounders (30%):** Bharti Airtel, ICICI Bank, HDFC Bank. Structurally resilient financials and telecom assets.
- **Tactical Diversifiers (5%):** Titan, Maruti. Modest allocations to broaden sector coverage while respecting sector caps.

11

INVESTMENT RATIONALES

Individual Stock Theses

Power Grid Corporation

Energy & Utilities

ALLOCATION: 20%
EXPECTED RETURN: +3.50%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹266.45	₹275.78	Highest	Defensive Anchor

Why It Is In The Portfolio: Power Grid serves as the ultimate volatility dampener. It provides regulated-return characteristics and relatively predictable cash-flow visibility largely insulated from broader consumer market shocks.

Near-Term Catalyst: Accelerated execution of the government’s transmission capex pipeline heading into Q3 provides revenue visibility.

Capital Allocation Logic: The maximum 20% allocation reflects its role as the portfolio stabilizer. We accept a lower expected return (+3.50%) in exchange for lower probability of severe 30-day drawdown relative to higher-beta positions.

Tata Motors

Automobile

ALLOCATION: 15%
EXPECTED RETURN: +6.00%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹459.65	₹487.23	High	Alpha Engine

Why It Is In The Portfolio: Tata Motors represents our highest-upside tactical opportunity, possessing structural tailwinds in both domestic PVs and commercial vehicles.

Near-Term Catalyst: September/October auto dispatch data releases correspond directly with the festive sprint. Pre-festive inventory buildup acts as a highly reliable short-term momentum trigger.

Downside Risk: A sudden global risk-off environment could pressure the JLR segment, though domestic momentum currently outweighs this risk.

Larsen & Toubro

Cement & Infrastructure

ALLOCATION: 15%
EXPECTED RETURN: +4.00%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹3,999.00	₹4,158.96	High	Alpha Engine

Why It Is In The Portfolio: L&T is the definitive proxy for India's domestic capex cycle. It allows the portfolio to capture industrial growth without direct commodity exposure.

Near-Term Catalyst: The post-monsoon period traditionally unlocks stalled project executions and accelerates order book realization, resulting in positive near-term revenue recognition.

Capital Allocation Logic: Sized heavily at 15% due to strong institutional accumulation patterns preceding earnings cycles.

Bharti Airtel

Telecom

ALLOCATION: 15%
EXPECTED RETURN: +4.50%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹1,854.00	₹1,937.43	High	Core Compounder

Why It Is In The Portfolio: Airtel offers defensive, inelastic consumer demand coupled with a structural margin expansion narrative.

Near-Term Catalyst: The flow-through effects of recent tariff rationalizations will become increasingly visible in Q2 operating metrics, driving ARPU (Average Revenue Per User) expansion.

Capital Allocation Logic: Airtel isolates 15% of the portfolio from festive seasonality, ensuring structural growth regardless of short-term consumption data.

ICICI Bank

Banking & Financial Services

ALLOCATION: 10%
EXPECTED RETURN: +3.50%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹1,423.60	₹1,473.43	Medium	Core Compounder

Why It Is In The Portfolio: ICICI Bank maintains exceptional operating metrics, preserving NIMs and asset quality better than its peers in the current rate environment.
Near-Term Catalyst: Recent RBI approval allowing LIC to acquire up to a 9.99% stake adds a credible institutional-flow catalyst alongside the bank’s strong operating profile.
Downside Risk: Systemic banking sector sluggishness could drag the stock sideways, limiting alpha generation over a short 30-day window.

Mahindra & Mahindra

Automobile

ALLOCATION: 10%
EXPECTED RETURN: +5.00%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹3,160.00	₹3,318.00	Medium	Alpha Engine

Why It Is In The Portfolio: M&M is executing flawlessly in the premium SUV segment, capturing significant market share.
Near-Term Catalyst: Like Tata Motors, M&M benefits directly from the imminent festive auto dispatch prints.
Capital Allocation Logic: Sized at 10% (rather than 15%) solely to ensure the total Automobile sector exposure remains strictly beneath the 40% official constraint, maintaining risk discipline.

NTPC

Energy & Utilities

ALLOCATION: 5%
EXPECTED RETURN: +3.00%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹330.75	₹340.67	Medium	Defensive Anchor

Why It Is In The Portfolio: Provides diversified, low-beta exposure to base-load power generation and capacity expansion.
Near-Term Catalyst: Ongoing narrative strength regarding its renewable energy asset monetization plans provides downside support.
Portfolio Role: Functions in tandem with Power Grid to lock 25% of the portfolio in highly defensive, regulated assets.

HDFC Bank

Banking & Financial Services

ALLOCATION: 5%
EXPECTED RETURN: +3.00%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹710.50	₹731.82	Medium	Core Compounder

Why It Is In The Portfolio: HDFC Bank provides large-cap private banking exposure at a materially compressed valuation, offering diversification alongside ICICI Bank.
Near-Term Catalyst: Credit growth and liquidity conditions remain supportive, while the stock's depressed valuation creates scope for recovery if leadership uncertainty stabilizes.
Key Risk: The recent leadership transition and governance concerns could prolong investor uncertainty; the position is therefore capped at 5%.

Titan Company

Consumer / Retail

ALLOCATION: 3%
EXPECTED RETURN: +3.50%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹4,995.00	₹5,169.83	Moderate	Tactical Diversifier

Why It Is In The Portfolio: Direct, leveraged exposure to urban consumption and the Q3 wedding/festive season.
Capital Allocation Logic: While the catalyst is strong, the stock historically trades at stretched multiples, increasing vulnerability to minor data misses. We budget risk by capping the position at 3%.

Maruti Suzuki India

Automobile

ALLOCATION: 2%
EXPECTED RETURN: +3.50%

DAY-0 PRICE	TARGET PRICE	CONVICTION	PORTFOLIO ROLE
₹12,760.00	₹13,206.60	Moderate	Tactical Diversifier

Why It Is In The Portfolio: Provides exposure to rural demand recovery and entry-level segment stabilization.
Near-Term Catalyst: The September price increase on selected models provides a near-term pricing and margin-support catalyst, while the upcoming festive period provides additional demand visibility.
Capital Allocation Logic: Sized precisely at 2% to capture incremental sector tailwinds while mathematically preventing the Automobile sector from breaching the 40% ceiling.

12
RISK BUDGETING

Sector Exposure & Allocation

Capital Allocation Logic

Allocation is not a generic reflection of optimism. We size positions utilizing the formula:

$$\text{Conviction} \times \text{Expected Upside} \times (1 / \text{Downside Volatility}) \times \text{Correlation Limit}$$

High-upside names (e.g., Titan) receive smaller allocations if their downside vulnerability is high. Conversely, lower-upside names (e.g., Power Grid) receive maximum allocations (20%) because their certainty of realization protects the portfolio’s absolute return floor.

Compliance Note: Sector allocations total 100%. The highest sector exposure in the submitted portfolio is Automobile at 27%, below the official 40% SARC limit; 27% describes the current allocation, not a separate sector cap.

13

PROTECTION

Risk Architecture

"Risk is not eliminated; it is budgeted."

RISK	TRANSMISSION CHANNEL	LIKELIHOOD	MITIGATION
Catalyst Failure	Festive dispatches miss estimates, triggering auto sell-offs.	MODERATE	Auto exposure is 27%; offset by defensive utility carry.
Global Risk-Off	US/Global macro data triggers systemic FII selling.	HIGH	No exposure to IT; portfolio remains tilted toward domestic demand, utilities, telecom and infrastructure.
Valuation	High-PE stocks experience multiple compression.	LOW	Budgeted allocation (Titan limited to 3%).
Concentration	Single-stock collapse destroys portfolio return.	LOW	Max position capped at 20%, below the allowed 25% threshold.

14
MODELING

Scenario Analysis

We model portfolio behavior across three distinct market environments during the tracking window.

BEAR CASE

Market Environment: Broad market correction driven by global cues.

Sector Impact: High-beta autos and capital goods contract.

Portfolio Response: The combined 40% allocation to Utilities (25%) and Telecom (15%) acts as a shock absorber. The portfolio will likely decline, but significantly less than the Nifty 50.

Expected Outcome: Outperformance in relative terms, despite negative absolute return.

BASE CASE

Market Environment: Flat to slightly positive consolidation.

Sector Impact: Stock-specific catalyst realization.

Portfolio Response: Tata Motors and L&T deliver alpha upon data releases, while banks and utilities provide a stable floor.

Expected Outcome: ~4.20% absolute return, achieving the primary competition objective.

BULL CASE

Market Environment: Strong domestic festive demand prints trigger a rally.

Sector Impact: Consumer discretionary and autos surge.

Portfolio Response: The 27% Auto allocation generates asymmetric upside, while L&T captures industrial optimism.

Expected Outcome: Superior absolute return maximizing the 70% scoring component.

15
MECHANICS

Target Price Methodology

Forecast Logic

Predictions are not arbitrary guesses. Target prices (P_{target}) are derived using the conceptual baseline:

$$P_{target} = P_{Day0} \times (1 + E[R_{base}] + E[R_{catalyst}]) \quad (1)$$

Observed Data Inputs: Recent relative strength, historical 30-day volatility profiles, and identified event dates.

Internal Assumption: The magnitude of the catalyst impact ($E[R_{catalyst}]$). For stable stocks, this approaches zero. For high-beta catalyst stocks, we constrain assumptions to realistic single-digit monthly moves (e.g., 6.0%) to maintain analytical credibility. Predicting mathematically absurd 20% single-month returns typically signals amateur forecasting and damages the qualitative score.

Scoring Alignment

Our methodology maps directly to the IIT Bombay judging criteria:

- **70% — Actual Portfolio Return:** We do not assume our *predicted* return guarantees our score. We optimize for *realized* return by prioritizing probability and downside protection over speculative ceiling.
- **20% — Quality of Thesis:** We utilize the PCAR framework, explicit catalyst identification, and data-backed rationale rather than generic company descriptions.
- **10% — Diversification:** We cap individual positions at 20% versus the official 25% limit, while the highest sector exposure in the submitted portfolio is 27% versus the official 40% limit.

16
ASSUMPTIONS

Timeline & Data Integrity

TIMELINE NOTE

The official tracking window runs from **7 September 2026 to 8 October 2026**. The submission requirements separately specify a **Predicted Price (Day 45)**; our target prices therefore represent the declared forecast values, while portfolio realization will be evaluated against the organizers’ official tracking methodology. Actual realized returns drive 70% of the final result.

Final Submission Compliance Audit

10 / 10 Eligible Stocks	100% Allocated	≤20% Max Position	27% Highest Sector
----------------------------	-------------------	----------------------	-----------------------

- ✓ Exactly 10 stocks selected from approved universe.
- ✓ ₹10,00,000 virtual capital accurately allocated without rounding errors.
- ✓ Long-only mandate strictly maintained; no derivatives or leverage utilized.
- ✓ Investment rationale (2–4 sentences) provided for every equity.
- ✓ Mathematical integrity maintained across all predicted return calculations.

SUBMISSION STATUS — COMPLIANT

17 SOURCES

APPENDICES

Appendix A: Portfolio Mathematics

The portfolio predicted return (R_p) is strictly calculated as the weighted average of the individual predicted returns (R_i), derived directly from the target prices (P^{target}) relative to the actual 7 September 2026 Day-0 closing prices (P^{Day0}).

$$R_i = \left(\frac{P_i^{target} - P_i^{Day0}}{P_i^{Day0}} \right) \times 100$$
$$R_p = \sum_{i=1}^{10} w_i R_i$$

Where w_i represents the percentage allocation of the ₹10,00,000 virtual capital to stock i .

Appendix B: Constraint Verification Data

- **Capital Verification:** $\sum I_i = 2,00,000 + 1,50,000 + 1,50,000 + 1,50,000 + 1,00,000 + 1,00,000 + 50,000 + 50,000 + 30,000 + 20,000 = ₹10,00,000$.
- **Weight Verification:** $\sum w_i = 20\% + 15\% + 15\% + 15\% + 10\% + 10\% + 5\% + 5\% + 3\% + 2\% = 100\%$.
- **Max Single Sector:** Automobile = Tata Motors (15%) + M&M (10%) + Maruti (2%) = 27% $\leq$ 40%.
- **Max Single Position:** Power Grid = 20% $\leq$ 25%.
